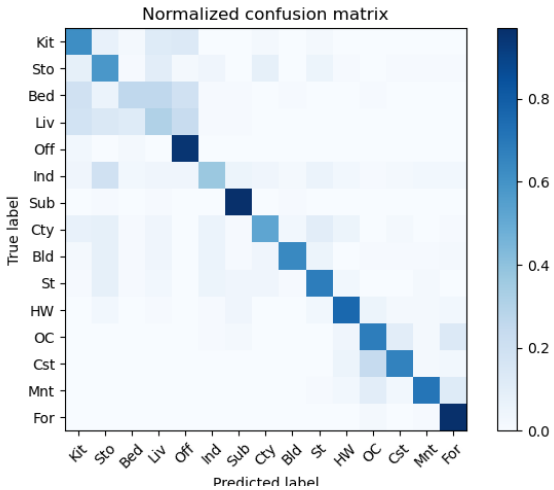
Computer Vision HW2 Report

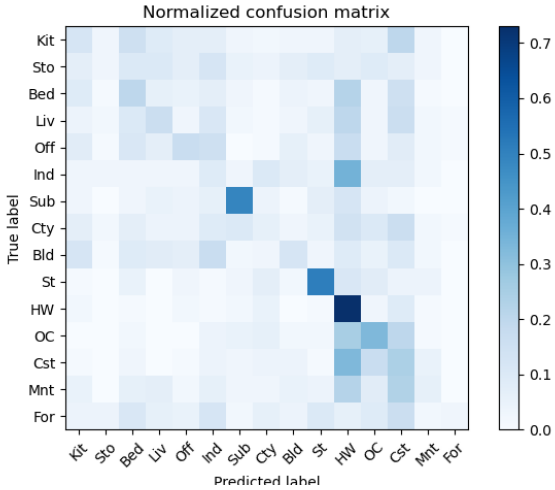
Student ID: B07901019
Name: 吳隆暉

Part 1. (10%)

• Plot confusion matrix of two settings. (i.e. Bag of sift and tiny image representation) (5%)

Ans:

Bag of sift	Tiny image
	




• Compare the results/accuracy of both settings and explain the result. (5%)

Ans:

The accuracy of bag of sift method goes up to 0.6453, while the accuracy of tiny image only reaches 0.2267.

Also, from the confusion matrices above, the accuracy of bag of sift method is apparently better than tiny image as the diagonal color darker than that of tiny image.

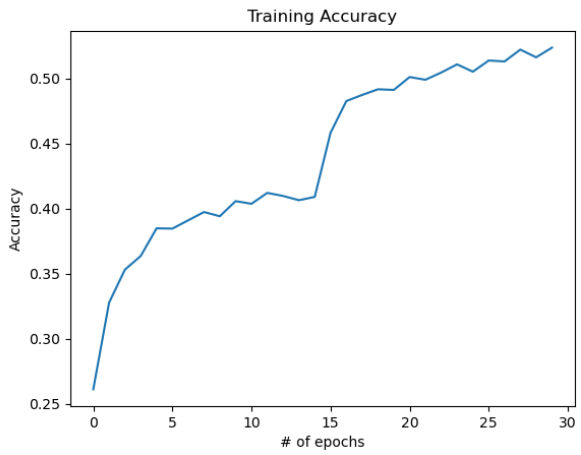
Part 2. (35%)

• Compare the performance on residual networks and LeNet. Plot the learning curve (loss and accuracy) on both training and validation sets for both 2 schemes. 8 plots in total. (20%)

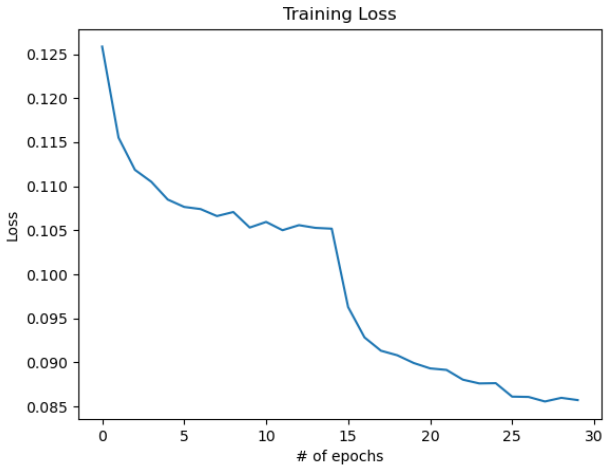
Ans:

LeNet

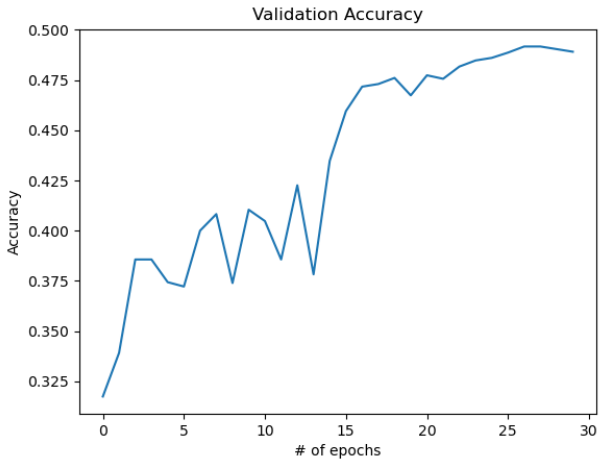
Training Accuracy



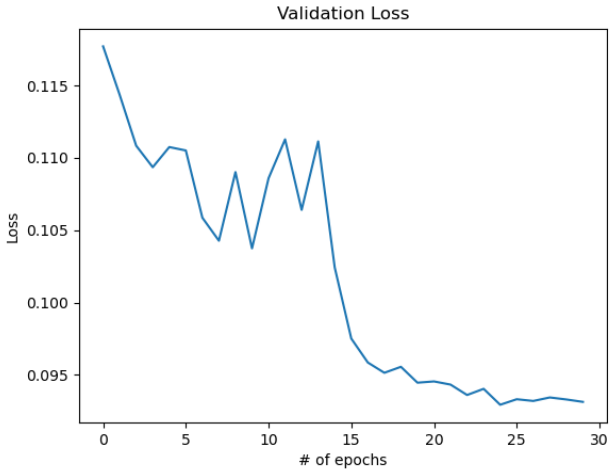
Training Loss



Validation Accuracy

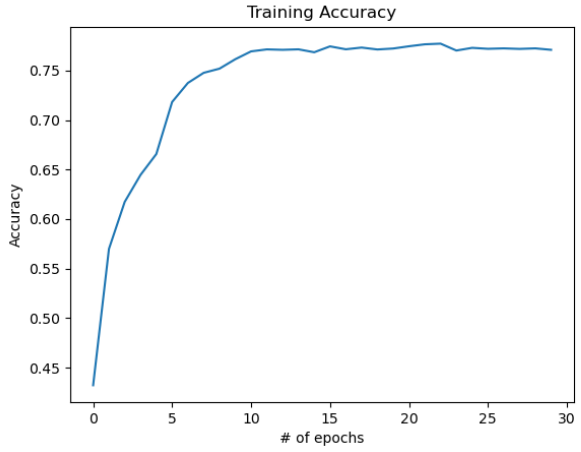


Validation Loss

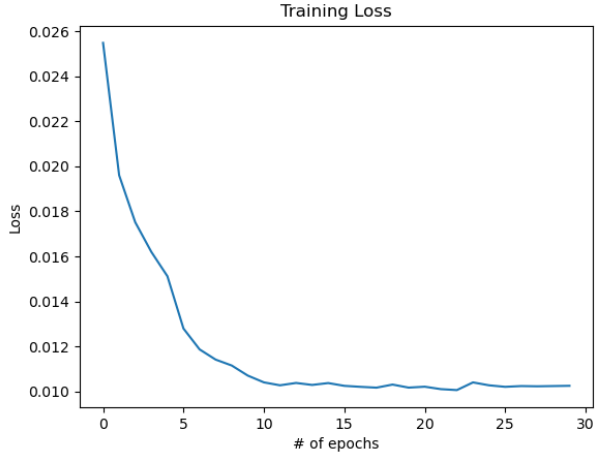


ResNet

Training Accuracy

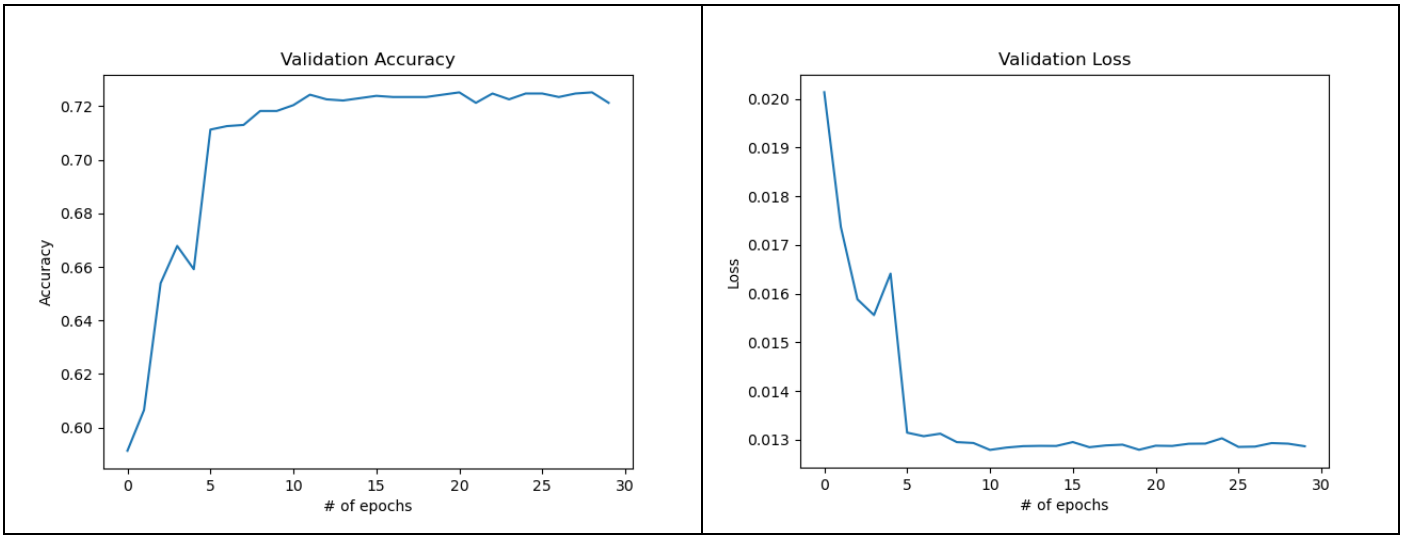


Training Loss



Validation Accuracy

Validation Loss



Private Case Evaluation Accuracy Performance: 0.8368

• Attach basic information of the model you use including model architecture and number of the parameters. (5%)

Ans:

I use resnet50 as the backbone of my own model, and I changed the fully connected layer at the end to output a tensor of length 10.

The number of parameters of my model: 23528522

My Model Architecture:

```
myResnet(
  (backbone): ResNet(
    (conv1): Conv2d(3, 64, kernel_size=(7, 7), stride=(2, 2), padding=(3, 3), bias=False)

      )
    )
```

• Briefly describe what method do you apply? (e.g. data augmentation, model architecture, loss function, semi-supervised etc.) (10%)

Ans:

I use two data augmentation transforms:

```
transforms.RandomHorizontalFlip(p = 0.5),
transforms.RandomPerspective(distortion_scale=0.5, p=0.5)
```

Also, I apply pretrained weights on ImageNet to improve the performance.
